1 Introduction

Okay, so we got rejected from the bulletin of Mathematical Biology. Overall, the two reviewers thought that the researchs aim and research questions were brilliant and they thought that our manuscript was very well-written. However, all the content was trivial and there was nothing new there. So they gave us three months to re-submit a new manuscript. The initial plan was to go through a bunch of famous models in mathematical biology and then present their symmetries as well as the differential invariants and so on. The thing that stopped us from doing this was the fact that our symbolic solver could not find the symmetries of these models.

So my suggestion here is that we try to find the symmetries of these models by hand essentially. Again, we study the following type of system of first order ODEs

$$\frac{dy_i}{dt} = \omega_i(t, y_1, \dots, y_k), \quad i = 1, \dots, k, \quad (1)$$

where the infinitesimal generator of the Lie group is given by

$$X = \xi \partial_t + \eta_1 \partial y_1 + \dots + \eta_k \partial y_k \quad (2)$$

and the prolonged generator is given by

$$X^{(1)} = X + \eta_1^{(1)} \partial y_1 + \dots + \eta_k^{(1)} \partial y_k. \quad (3)$$

Now, given this prolonged generator, the *linearised symmetry conditions* are defined as follows:

$$X^{(1)} \left(\frac{dy_i}{dt} - \omega_i(t, y_1, \dots, y_k) \right) = 0, \quad i = 1, \dots, k. \quad (4)$$

In particular, using the *total derivative*

$$D_t = \partial_t + y'_1 \partial y_1 + \dots + y'_k \partial y_k \quad (5)$$

these symmetry conditions can be written as follows

$$D_t \eta_i - \omega_i D_t \xi = X(\omega_i(t, y_1, \dots, y_k)), \quad i = 1, \dots, k. \quad (6)$$

So to increase the impact, we probably need to solve equation (6) for a bunch of biologically relevant models. This document is the start of that journey, and below I will list the models that I figured that we can focus on.

The Lotka-Volterra model:

$$\begin{aligned}\frac{du}{dt} &= u(1 - v), \\ \frac{dv}{dt} &= \alpha v(u - 1).\end{aligned}\tag{7}$$

The BZ model

$$\begin{aligned}\frac{du}{dt} &= \frac{1}{\varepsilon}v - \frac{1}{\varepsilon}\left(\frac{1}{3}u^3 - u\right), \\ \frac{dv}{dt} &= -u.\end{aligned}\tag{8}$$

The Lorenz equations:

$$\begin{aligned}\frac{du}{dt} &= a(v - u), \\ \frac{dv}{dt} &= -uw + bu - v, \\ \frac{dw}{dt} &= uv - cw.\end{aligned}\tag{9}$$

The Brusselator:

$$\begin{aligned}\frac{du}{dt} &= 1 - (b - 1)u + au^2v, \\ \frac{dv}{dt} &= bu - au^2v.\end{aligned}\tag{10}$$

The SIR model:

$$\begin{aligned}\frac{dS}{dt} &= -rSI, \\ \frac{dI}{dt} &= rSI - aI, \\ \frac{dR}{dt} &= aI.\end{aligned}\tag{11}$$

The MM system:

$$\begin{aligned}
\frac{ds}{dt} &= -k_1 es + k_{-1} c, \\
\frac{dc}{dt} &= k_1 es - (k_{-1} + k_2) c, \\
\frac{de}{dt} &= -k_1 es + (k_{-1} + k_2) c, \\
\frac{dp}{dt} &= k_2 c.
\end{aligned} \tag{12}$$

The Goodwin model (with n=1):

$$\begin{aligned}
\frac{dR}{dt} &= -b_1 R + \frac{K}{1 + \beta T^n} = \omega_1(R, L, T) \\
\frac{dL}{dt} &= g_1 R - b_2 L = \omega_2(R, L, T) \\
\frac{dT}{dt} &= g_2 L - b_3 T = \omega_3(R, L, T)
\end{aligned} \tag{13}$$

So let's go through these models one by one and see if we can find any symmetries. Let's start with the Lotka-Volterra model!

2 Lotka-Volterra

We remind ourselves that we want to study the Lotka-Volterra model:

$$\begin{aligned}
\frac{du}{dt} &= u(1 - v), \\
\frac{dv}{dt} &= \alpha v(u - 1),
\end{aligned}$$

and we are looking for a generator of the following kind:

$$X = \xi(t)\partial_t + \eta_1(t, u, v)\partial_u + \eta_2(t, u, v)\partial_v \tag{14}$$

which implies that the generator is *fibre preserving*. Now, derive the linearised symmetry conditions in equation (6) by plugging in our model in equation (7). Given that we have autonomous reaction terms, our linearised symmetry conditions can be written as follows:

$$a(u-1)v\frac{\partial\eta_1}{\partial v} - (1-v)\eta_1 + (1-v)u\frac{\partial\eta_1}{\partial u} - (1-v)u\frac{d\xi}{dt} + \eta_2u + \frac{\partial\eta_1}{\partial t} = 0, \quad (15)$$

$$-a(u-1)\eta_2 + a(u-1)v\frac{\partial\eta_2}{\partial v} - a(u-1)v\frac{d\xi}{dt} - a\eta_1v + (1-v)u\frac{\partial\eta_2}{\partial u} + \frac{\partial\eta_2}{\partial t} = 0. \quad (16)$$

These equations correspond to a coupled system of first order PDEs in two variables (u and v) where we consider $d\xi/dt$ to be an unknown function. A property of these equations, is that they are decoupled in the sense that Equation (15) contains η_2 in only one place while Equation (16) contains η_1 in only one place. Thus, we can, for example, solve Equation (15) for η_2 and then substitute this into Equation (16). Essentially, this will convert the system to a single PDE of order two in three variables (t, u, v). Using sympy as a tool for conducting the differentiations and simplifications, we will now present the results of these calculations. Equation (15) can be re-written as follows:

$$\eta_2 = -av\frac{\partial\eta_1}{\partial v} + \frac{av\frac{\partial\eta_1}{\partial v}}{u} - \frac{\eta_1v}{u} + \frac{\eta_1}{u} + v\frac{\partial\eta_1}{\partial u} - v\frac{d\xi}{dt} - \frac{\partial\eta_1}{\partial u} + \frac{d\xi}{dt} - \frac{\frac{\partial\eta_1}{\partial t}}{u}. \quad (17)$$

Now, by substituting Equation (17) into Equation (16) the following equation is obtained:

$$\begin{aligned} & -a^2u^2v^2\frac{d^2}{dv^2}\eta_1 + 2a^2uv^2\frac{d^2}{dv^2}\eta_1 - a^2v^2\frac{d^2}{dv^2}\eta_1 - a\eta_1uv - a\eta_1u + a\eta_1 + 2au^2v^2\frac{d^2}{dvdu}\eta_1 \\ & - 2au^2v\frac{d^2}{dvdu}\eta_1 + au^2\frac{\partial\eta_1}{\partial u} - au^2\frac{d\xi}{dt} - auv^2\frac{\partial\eta_1}{\partial v} - 2auv^2\frac{d^2}{dvdu}\eta_1 + auv\frac{\partial\eta_1}{\partial v} \\ & + 2auv\frac{d^2}{dvdu}\eta_1 - auv\frac{\partial^2\eta_1}{\partial t\partial v} - au\frac{\partial\eta_1}{\partial u} + au\frac{d\xi}{dt} \\ & + au\frac{\partial\eta_1}{\partial t} + 2av^2\frac{\partial\eta_1}{\partial v} - 2av\frac{\partial\eta_1}{\partial v} + av\frac{\partial^2\eta_1}{\partial t\partial v} \\ & - a\frac{\partial\eta_1}{\partial t} - \eta_1v^2 + 2\eta_1v - \eta_1 - u^2v^2\frac{d^2}{du^2}\eta_1 + 2u^2v\frac{d^2}{du^2}\eta_1 - u^2\frac{d^2}{du^2}\eta_1 + uv^2\frac{\partial\eta_1}{\partial u} \\ & - 2uv\frac{\partial\eta_1}{\partial u} + uv\frac{\partial^2\eta_1}{\partial t\partial u} + u\frac{\partial\eta_1}{\partial u} - u\frac{\partial^2\eta_1}{\partial t\partial u} - v\frac{\partial\eta_1}{\partial t} + \frac{\partial\eta_1}{\partial t} = 0. \end{aligned} \quad (18)$$
